Academics: Role Flow

How the Academics seat works in the Faculty Management System, with illustrated screens.

1. What Academics is

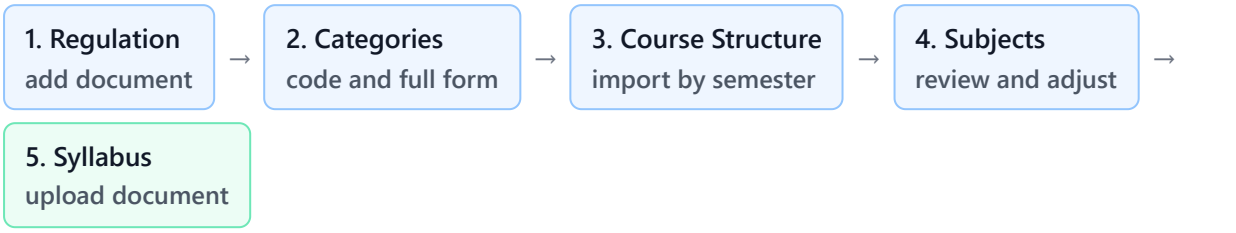

Academics is the college-wide owner of the curriculum. It keeps the regulations, the subject categories, each course's structure by department and semester, the subject list and the syllabus documents. It can also open any department's teaching assignments for oversight, and view published timetables.

Academics is a **seat**, not a separate kind of login. A faculty member holds it, signs in as usual and then picks **Academics** in the **Working as** switcher. A college can have more than one Academics holder. The Principal appoints the seat from Role Assignments.

> All screens in this document are illustrations drawn from the page layouts, with placeholder names, codes and numbers. They contain no real college data.

2. End-to-end flow

The curriculum is built from the top down, and every step is chosen by Regulation first:

1. **Regulation**: choose a regulation and course, then attach the regulation's reference document.
2. **Categories**: define each subject category once as a short code plus its full form, so import files can use either.
3. **Course Structure**: download the template, fill in the subjects per semester, upload and check it, then import. Nothing is saved unless every row is valid.
4. **Subjects**: review the result for a department, year and semester, and add, edit or remove individual subjects.
5. **Syllabus**: upload each department's syllabus document for the course.

Teaching Assignments (cross-department oversight) and Timetable View (read only) sit alongside this flow.

3. What Academics can reach

Sidebar item	What it does
Regulation, Course Structure, Subjects, Syllabus	The curriculum work described above.

Timetable View	Read-only published timetables, with PDF and Excel download.
My Profile, My Leave, Adjustment Requests	Personal pages that every faculty-type role has.
Categories, Teaching Assignments	Reached from the dashboard card and by direct address; not in the default sidebar.

Every page checks permission on the server for its own data. Hiding a menu item is not what protects it.

4. Screen by screen

Dashboard

`/academics`

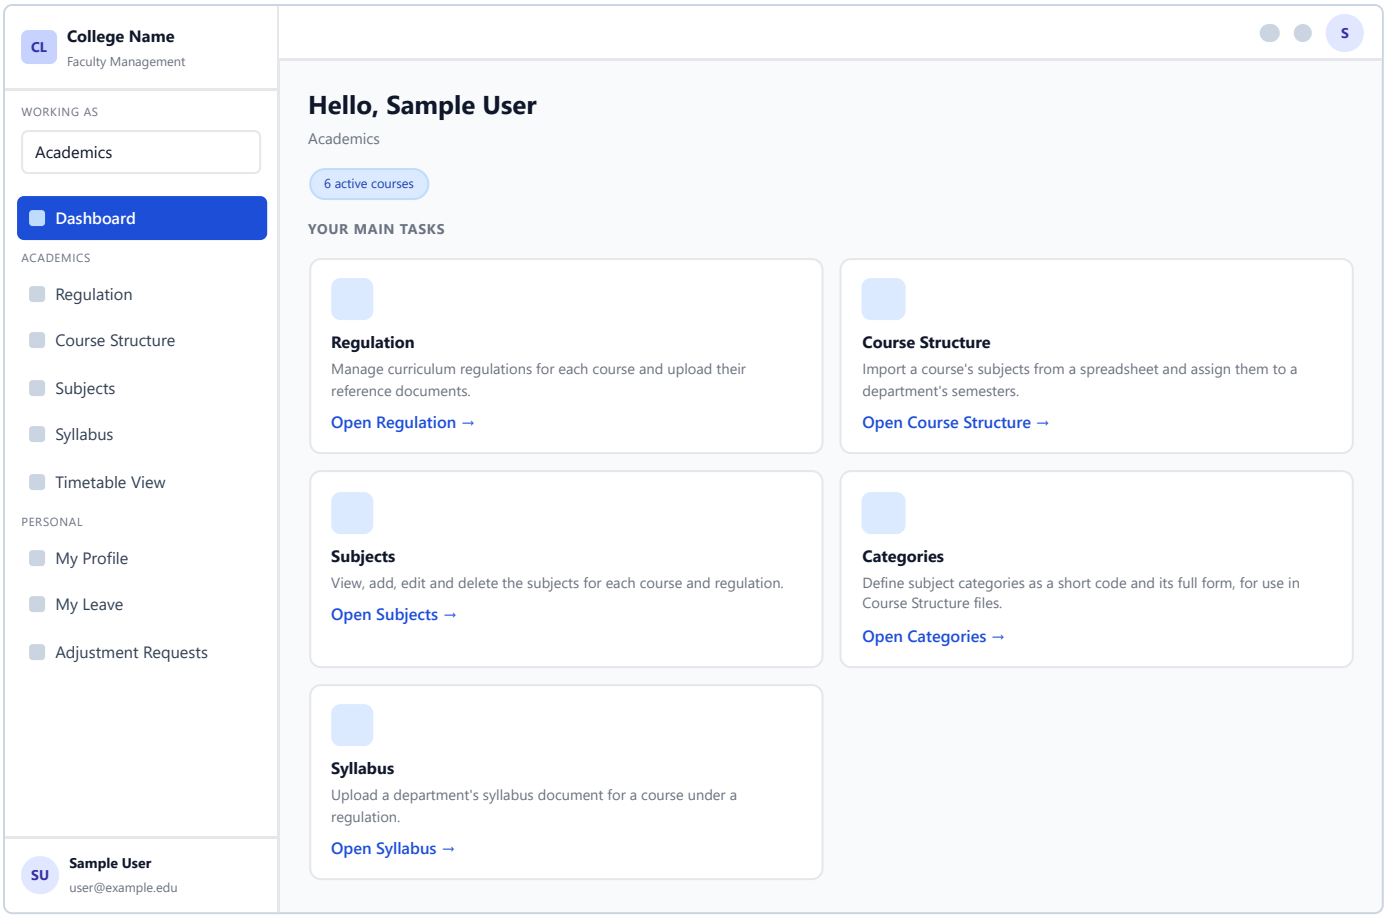

Figure 1. Dashboard (illustration with placeholder data)

The home page. A chip shows how many active courses the college has, and five task cards lead to the main jobs: Regulation, Course Structure, Subjects, Categories and Syllabus.

What the user does here

1. Read the course count chip to confirm the right college data is loaded.
2. Open a task card to start that job. Each card goes to the same page as the matching sidebar item (Categories has no sidebar item, so this card is its way in).

> Academics is a seat held by a faculty member. After signing in, use the **Working as** switcher in the sidebar to choose Academics. The Principal appoints the seat from Role Assignments.

Regulation

`/academics/regulation`

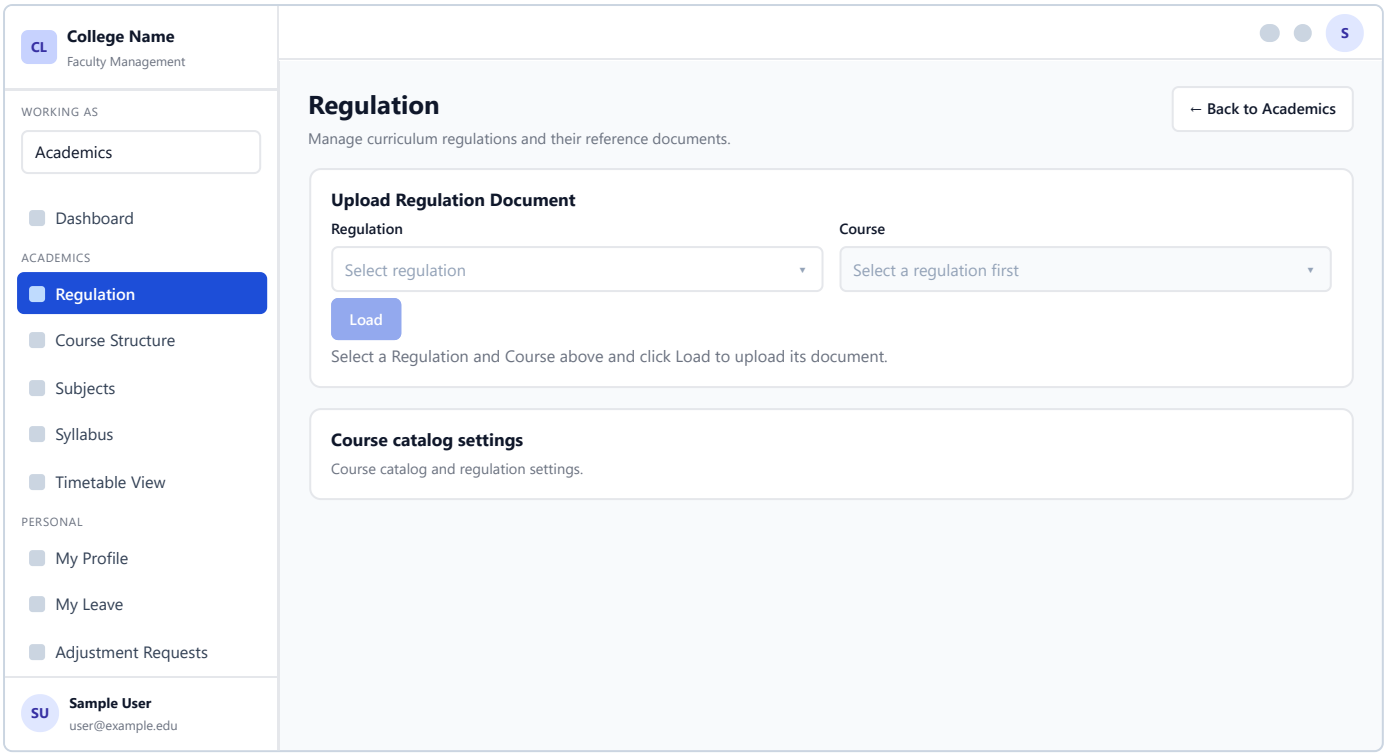

Figure 2. Regulation (illustration with placeholder data)

Holds the regulation (for example R20 or R23) for each course and the reference document that goes with it. Choose a regulation and a course, load them, and attach or replace the document.

What the user does here

1. Pick a **Regulation**, then a **Course**. The course list stays disabled until a regulation is chosen.
2. Press **Load**.
3. Upload the regulation document for that course, or remove the existing one.

> Everything later in the flow (Course Structure, Subjects, Syllabus) is chosen by Regulation first, so set up regulations before anything else.

Categories

`/academics/categories`

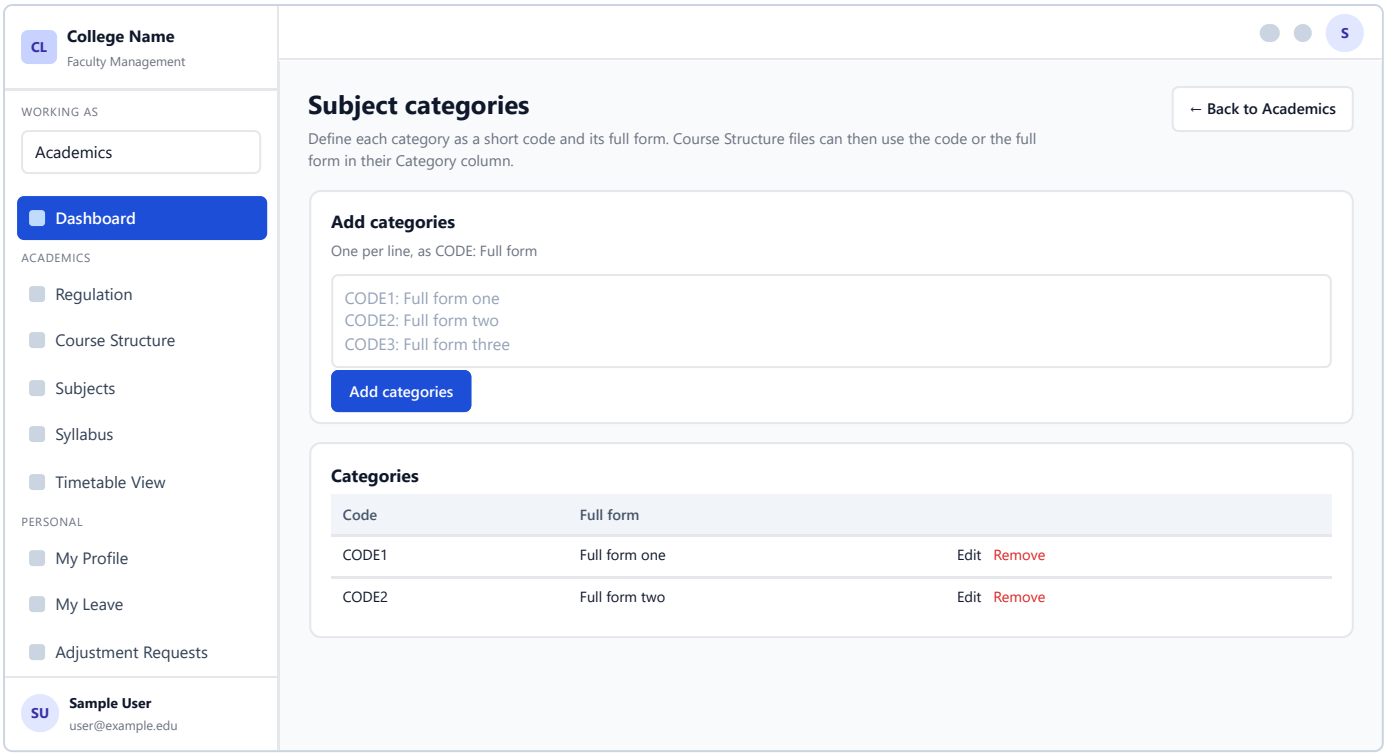

Figure 3. Categories (illustration with placeholder data)

Defines the subject categories as a short code plus its full form. Course Structure import files can then use either the code or the full form in their Category column.

What the user does here

1. Type one category per line as **CODE: Full form**.
2. Press **Add categories**. The button stays disabled until every line is valid.
3. Use **Edit** to change a category or **Remove** to delete it.

> A category that existing subjects use cannot be removed.

Course Structure

`/academics/course-structure`

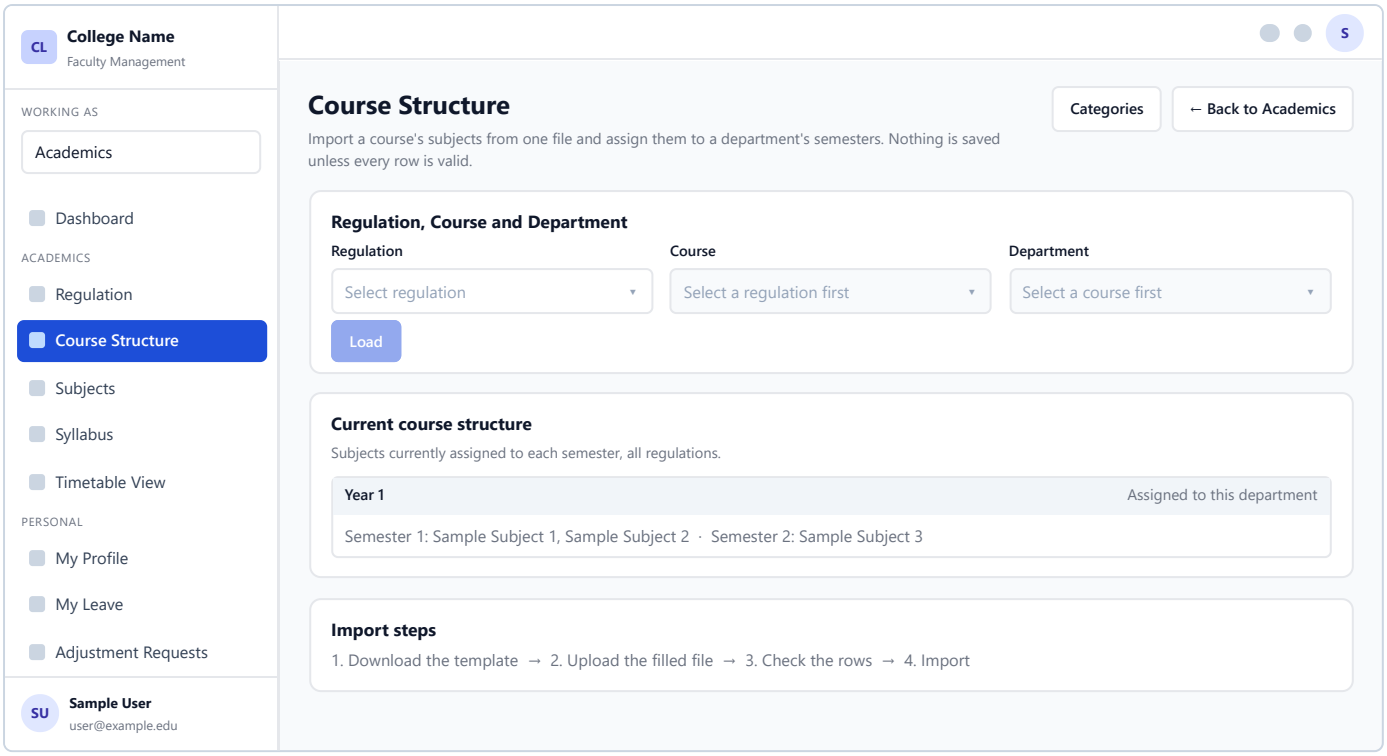

Figure 4. Course Structure (illustration with placeholder data)

Builds a course's subject list for a department from a spreadsheet. The upper part shows what is already assigned, year by year and semester by semester. The lower part is a four-step import: download the template, upload the filled file, check the rows, then import.

What the user does here

1. Choose **Regulation**, **Course** and **Department**, then press **Load**. The page shows the current structure for that department.
2. **Download template (.xlsx)** and fill it in with the subjects for each semester.
3. **Upload** the file. The page checks every row and lets you filter to problem rows only.
4. If a row uses a category that is not defined yet, open Categories, define it, then press **I've defined them, check again**.
5. Press **Import** once every row is valid. Use **Clear** to start again.

> Nothing is saved unless every row is valid, so a single bad row blocks the import until it is fixed.

Subjects

`/academics/subjects`

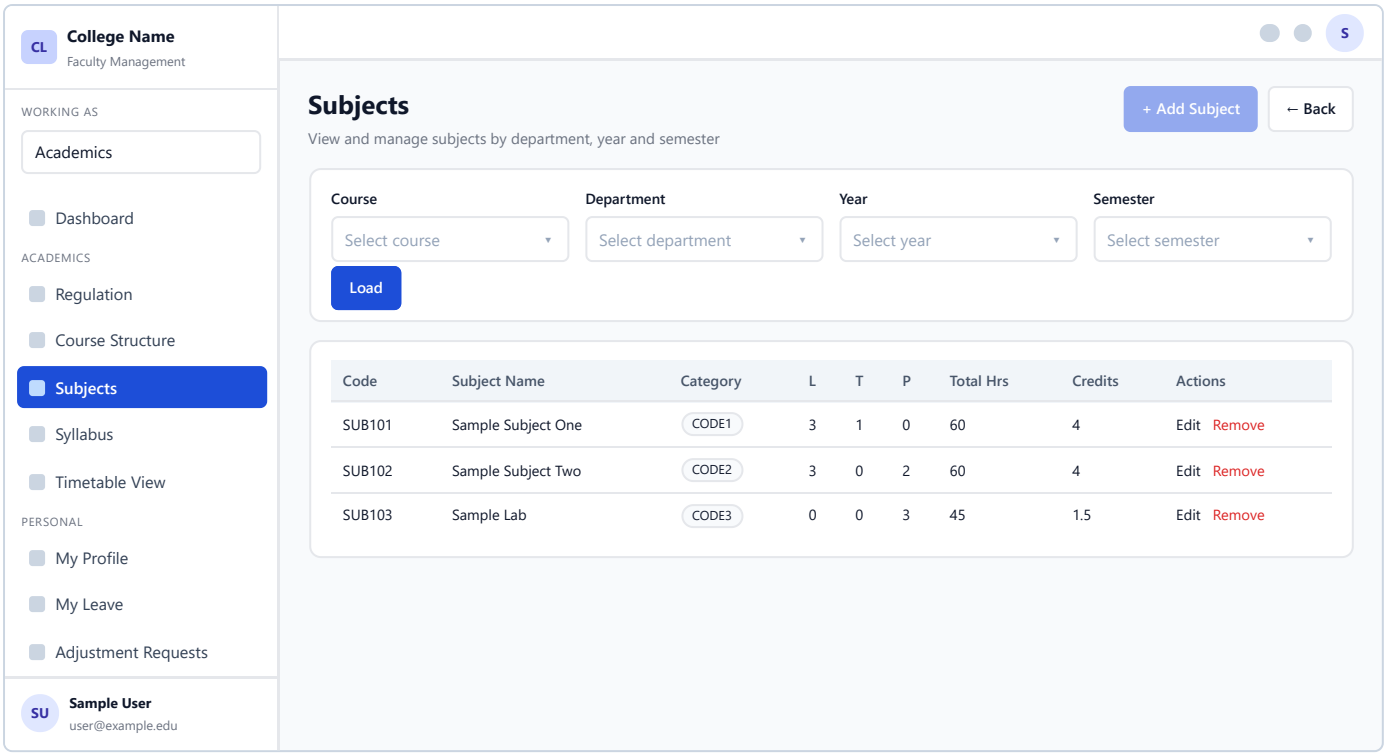

Figure 5. Subjects (illustration with placeholder data)

The subject register. After choosing a course, department, year and semester, the table lists each subject with its code, name, category, lecture/tutorial/practical hours, total hours and credits.

What the user does here

1. Choose **Course**, **Department** (and a Sub-department if the department has them), **Year** and **Semester**, then press **Load**.
2. Press **Add Subject** to add one: regulation, S.No., subject name, code, short code, type and category, and optionally to list the same subject under other departments.
3. Use **Edit** to change a subject (name, codes, type, category, total hours per semester) or **Remove** to delete it.

> Add Subject stays disabled until a course, department, year and semester are all chosen. For many subjects at once, use Course Structure import instead.

Syllabus

`/academics/syllabus`

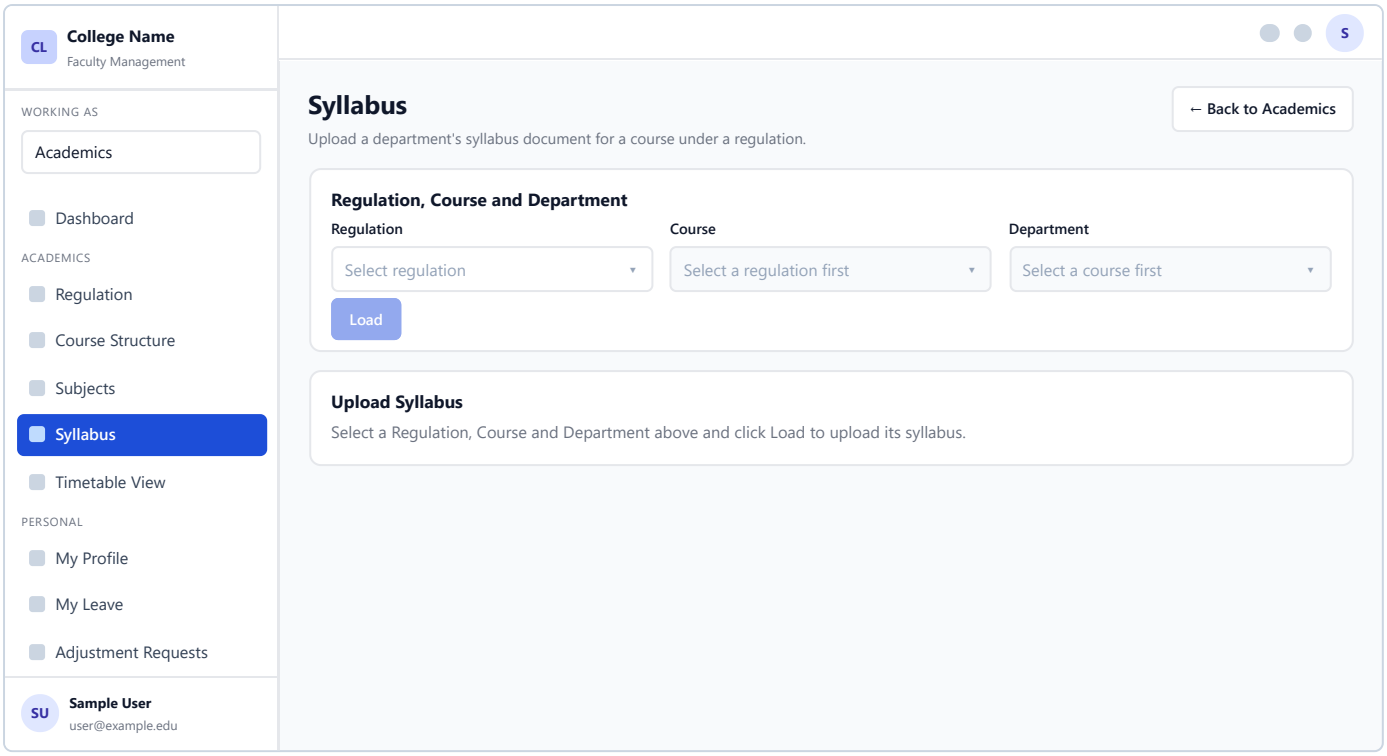

Figure 6. Syllabus (illustration with placeholder data)

Stores each department's syllabus document for a course under a regulation. It uses the same Regulation, Course and Department choice as Course Structure.

What the user does here

1. Choose **Regulation**, **Course** and **Department**, then press **Load**.
2. Upload the syllabus document, or replace or remove the existing one.

Teaching Assignments

`/academics/teaching-assignments`

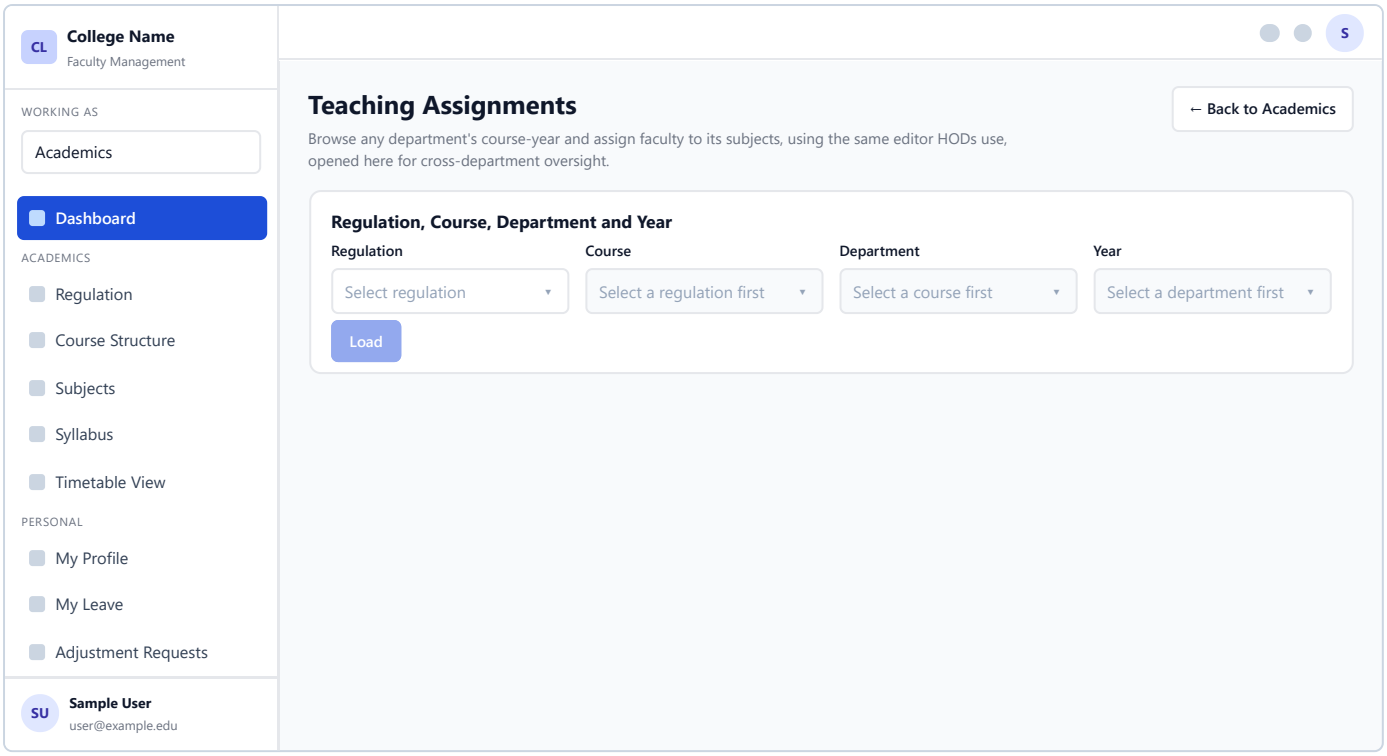

Figure 7. Teaching Assignments (illustration with placeholder data)

Lets Academics open any department's course-year and assign faculty to its subjects. It is the same editor HODs use, opened for cross-department oversight.

What the user does here

1. Choose **Regulation**, **Course**, **Department** and **Year**, then press **Load**.
2. Assign faculty to the listed subjects in the editor that opens.

> The page exists at this address but is not in the default sidebar, so it is reached by link or direct address.

Timetable View

`/academics/timetable-view`

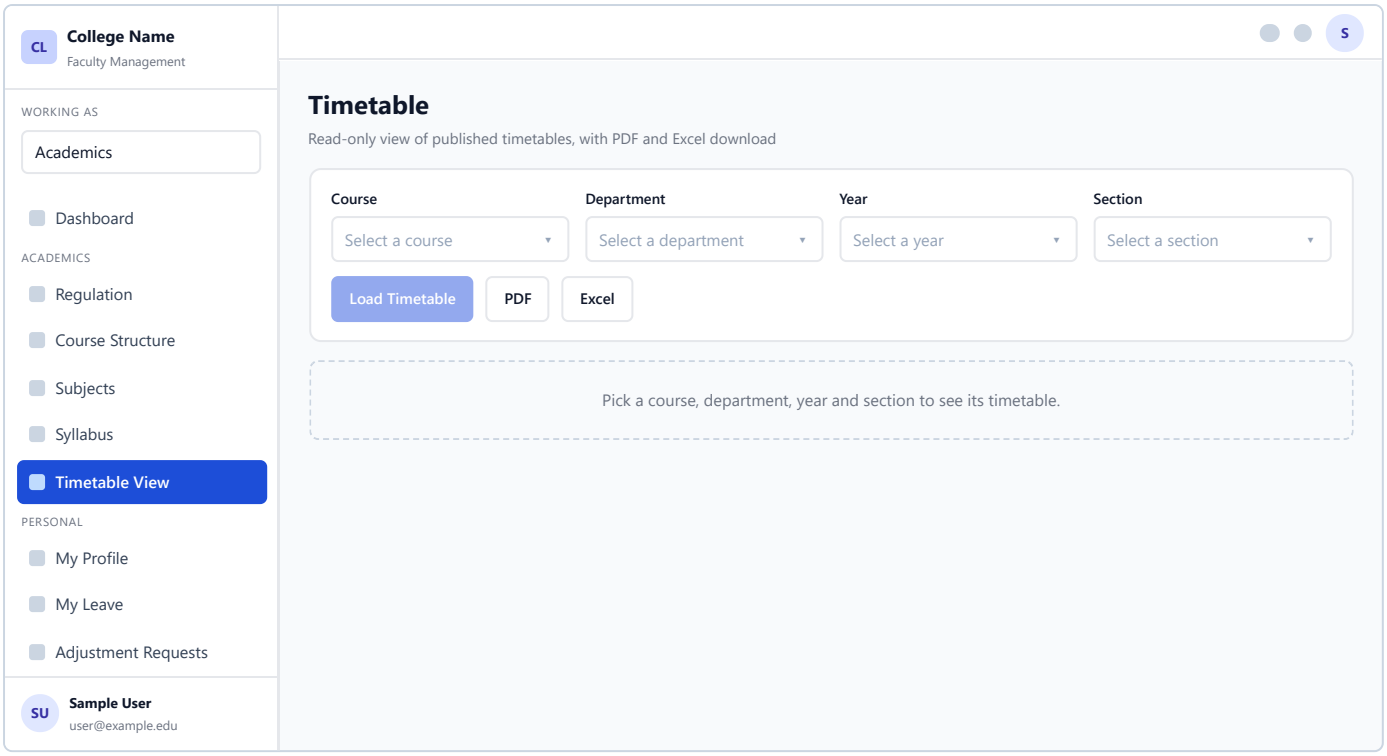

Figure 8. Timetable View (illustration with placeholder data)

A read-only view of published timetables, the same page Principal and Vice Principal use. Pick a course, department, year and section, then download as PDF or Excel if needed.

What the user does here

1. Choose course, then department, year and section.
2. Load the timetable, then use the PDF or Excel buttons to download it.

> Academics only views timetables here. Building and publishing them is done elsewhere.

My Profile

`/academics/profile`

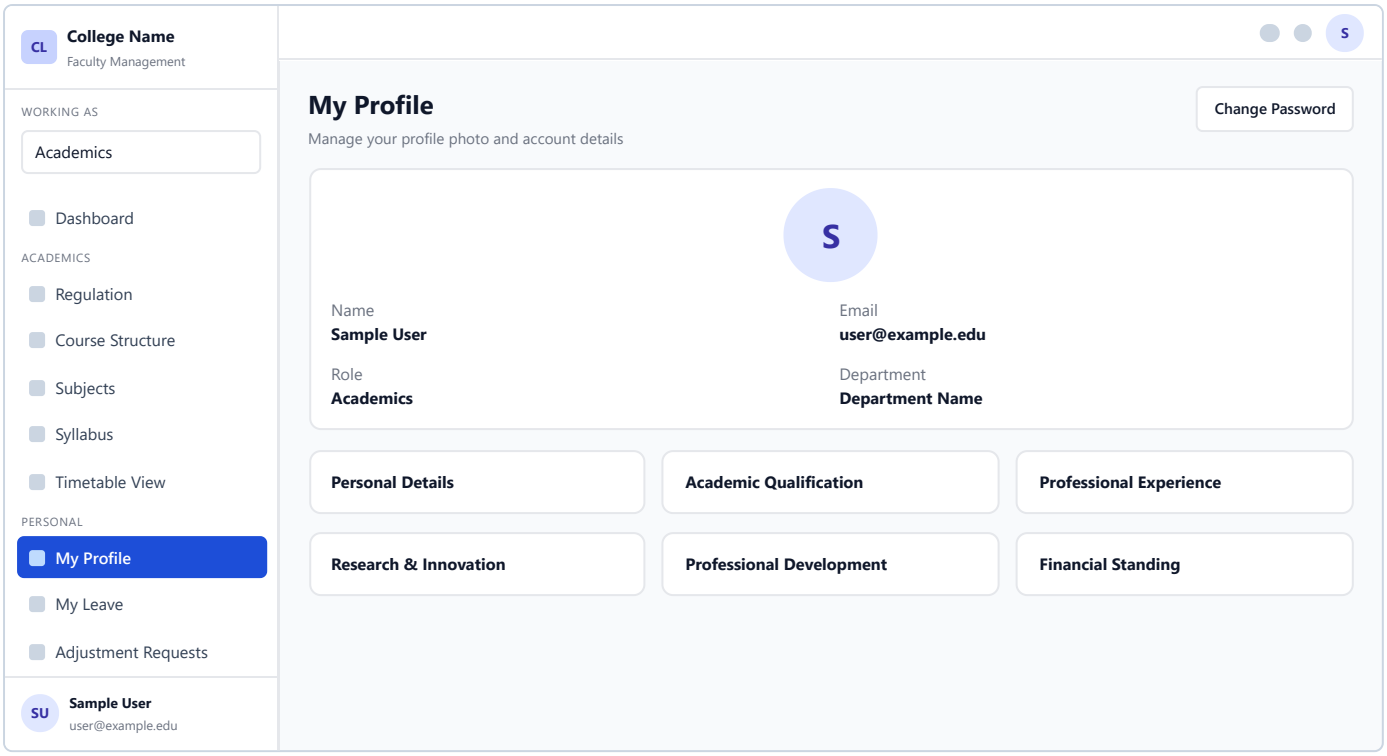

Figure 9. My Profile (illustration with placeholder data)

The person's own account page: photo, name, email, role and department, and a set of profile sections (Personal Details, Academic Qualification, Professional Experience and others).

What the user does here

1. Open any section card to view or edit that part of the profile.
2. Use **Change Password** to set a new password.

My Leave

`/academics/leave`

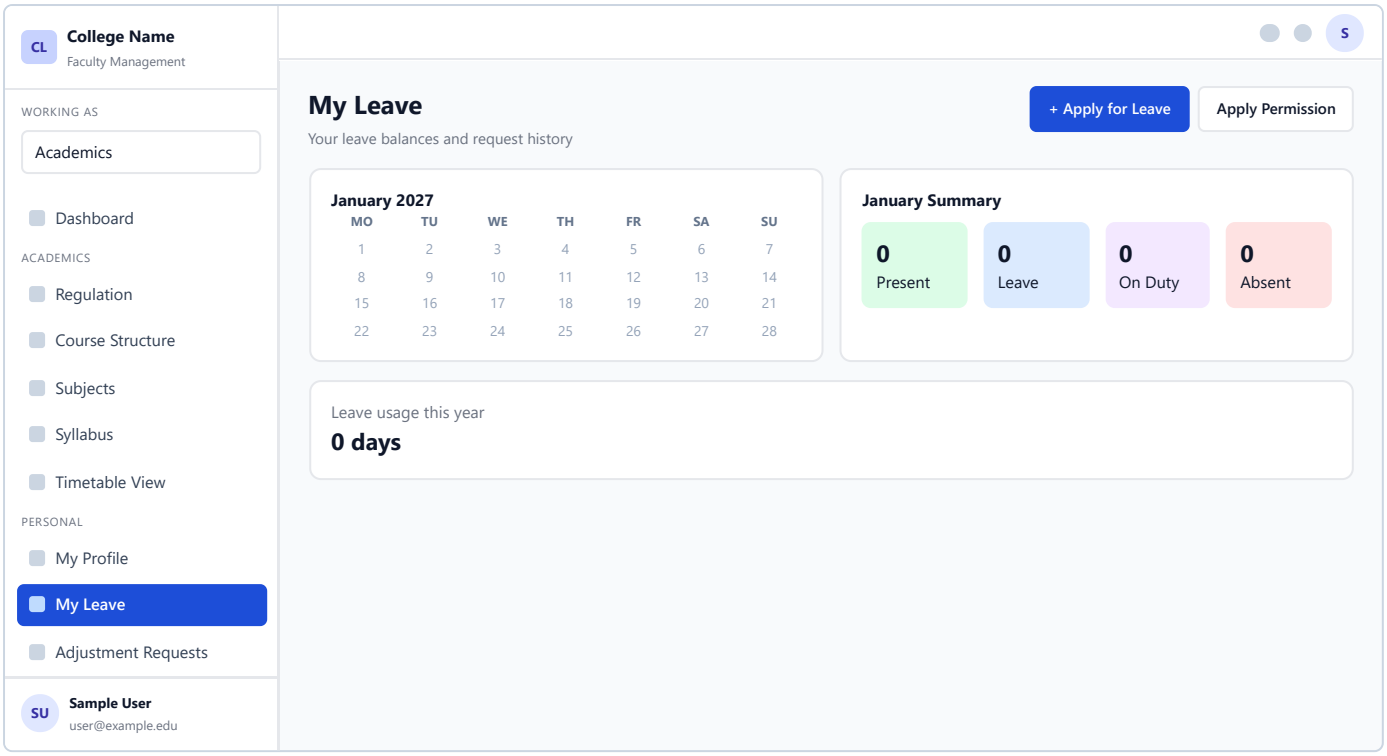

Figure 10. My Leave (illustration with placeholder data)

The person's own leave record: a month calendar, a summary of attendance days, the year's usage and the balance for each leave type.

What the user does here

1. Press **Apply for Leave** or **Apply Permission**.
2. Follow the request through Awaiting decision, Approved or Rejected.
